Parts: N/S
Additional Resources: Advanced Electrical Check

*** Unplug the grinder from power supply ***

This guide covers several power-related symptoms and how to troubleshoot them.

No Power to the Display
Page 2

Display is On - Motor does not Engage
Page 3

If this guide does not resolve your issue, refer to the Advanced Electrical Check guide.
Symptoms include:
- Display is dark.
- LED’s do not light up.

Unplug the power cord from the back of the grinder and from the wall.

Plug the cord into the back of the grinder firmly.

Plug the cord into the wall.

If the display remains dark, proceed to the Electrical Check Advanced guide.
Symptoms include:
- Display is on and counts/displays weight reading.
- No motor sound.

There are two safety interlock switches that must be engaged in order for the motor to run.

The first is engaged by the adjustment ring.

The second is engaged by the hopper.
Rotate the hopper clockwise and listen carefully for the click of a switch being engaged.

If you do not hear a switch click, remove the hopper and inspect for broken legs.
If a leg is broken, insert the hopper so that an intact leg enters the slot closest to the embossed BARATZA and rotate clockwise.

Slowly rotate towards setting 1 to the right, and listen carefully. When the adjustment ring moves past setting 31, you should hear the click of the safety switch engaging.

Rotate the adjustment ring to the left past setting 31.

Safety interlock is engaged at setting 31 and below.
Ensure that the grind setting indicator tab is painted black. If it is blue, then the adjustment ring has been installed backward and must be re-installed correctly.

If the motor will still not engage, proceed to the Advanced Electrical Check guide.
